Domain Driven Design, Immutability and C++. There is a powerful and simple concept in programming that is widely underused: Immutability. Basically, an object is immutable if its state doesn't change once the object has been created. Consequently, a class is immutable if its instances are

immutable. There is one important argument in favor of using immutable objects: It dramatically simplifies concurrent programming.

Some interpretations of Domain-Driven Design do advocate data-modeling, and I think this is what your question is about. In this interpretation "Entities" and "Value Objects" are essentially function-less data holders only, and the design concerns itself with what properties these hold and what relation they have between each other.

CQRS dovetails beautifully with Clean Domain-Driven Design because it is a behavioral pattern: Clean DDD is the what, CQRS is the how. Before I dig deeper, I want to make clear that you don't NEED to use CQRS to implement Clean Architecture or Clean DDD solutions, but why wouldn't you use it?

A Brief Intro to Clean Architecture, Clean DDD, and CQRS ...

While CQRS does not require DDD, domain-driven design makes the distinction between commands and queries explicit, around the concept of an aggregate root. The idea is that a given aggregate root has a method that corresponds to a command and a command handler invokes the method on the aggregate root.

Domain-driven design (DDD) advocates modeling based on the reality of business as relevant to your use cases. In the context of building applications, DDD talks about problems as domains. It describes independent problem areas as Bounded Contexts (each Bounded Context correlates to a microservice), and emphasizes a common language to talk about ...
