`nvram_build` reverses what `nvram_dump` does, taking a file of "name=value" entries and turning them back into a valid DD-WRT NVRAM backup file. It handles both of the ways of handling newlines in values that `nvram_dump` does, so you can send any `nvram_dump` output back through `nvram_build` to recreate the backup. The command looks like:

Non-volatile random-access memory (NVRAM) is random-access memory that retains data without applied power. This is in contrast to dynamic random-access memory (DRAM) and static random-access memory (SRAM), which both maintain data only for as long as power is applied, or such forms of memory as magnetic tape, which cannot be randomly accessed but which retains data indefinitely without ...
